SHEEP HOOF REMOVER 800D

**USE**

Using the same principle as the type 400D machine, the type 800D spur remover is intended to remove the dew-claws from sheep. In principle, a sheep's nails come off by themselves during the dehairing phase in La Parmentière dehairing machines.

The nails can be removed from frozen feet after slight defrosting.

PERFORMANCE

The 800D spur removal machine facilitates high speed working and approximately 600 spurs can be removed per hour.

The work is done without pre-heating.
